Book Descriptions:

We have made it easy for you to find a PDF Ebooks without any digging. And by having access to our ebooks online or by storing it on your computer, you have convenient answers with camos flatsat manual crank-up satellite dish . To get started finding camos flatsat manual crank-up satellite dish , you are right to find our website which has a comprehensive collection of manuals listed.

Our library is the biggest of these that have literally hundreds of thousands of different products represented.

Book Descriptions:

camos flatsat manual crank-up satellite dish

Location of the lift assembly must allow antenna to point towards the rear of the vehicle when resting in the travel position, and must clear all roof mounted equipment when being raised, lowered or rotated. The inside ceiling must be clear of obstructions to ceiling plate and handle. Follow the manufacturer's guidelines for surface preparation, application and curing. Feed the cable sideways through the lift assembly, then insert cable through gland in rear of roof entry box and push cable into vehicle. Leave 70 cm of cable see indication from antenna to roof entry. Turn the indicator of rotation handle into the area of desired satellite, which appears highlighted in colour on the graduation disc. Technical Details Model Camos SelfSat Top Frequency range 10.7 12.75 GHz Polarisation Dual Linear horizontal and vertical Gain 33 dBi bei 12.75 GHz. Has anybody got one of these what is reception like and in what parts of the country have you tried it will it work in the north of Scotland and how easy is it to set up once installed. Many thanks. I suggest that you have a look at the Roadpro website. Very helpful company. Also they are very sturdy in stronger winds as opposed to a dish. Hope this helps Pat. Its genuine! I fitted the flat sat myself in a couple of hours without too many problems, Its never a very pleasant experience drilling a hole in your new motorhome, but the kit came with a very useful template to use as drilling guide, so the process of fitting the flat sat was very simple. I have a sky digibox permanently fitted in my van so by just taking my sky card from home enjoy all the same channels i receive at home. So far I have had a week on the west coast of Scotland, and a weekend in wales, and so far have had no problems in receiving a great signal where ever we go. Website link removed by moderators Andy from RoadPro Sorry, havent worked out to make link go into text yet. Any advice appreciated. Its genuine! <http://2014.muces.es/admin/fck/canon-powershot-a570is-manual-pdf.xml>

• 1.0.

I fitted the flat sat myself in a couple of hours without too many problems, Its never a very pleasant experience drilling a hole in your new motorhome, but the kit came with a very useful template to use as drilling guide, so the process of fitting the flat sat was very simple. I have a sky digibox permanently fitted in my van so by just taking my sky card from home enjoy all the same channels i receive at home. Any advice appreciated. It was the easy way look at it rather than search Roadpro on Google. I know there is supposed to be no advertising but Andy is a usefull member on here as are Eddy and Snelly etc. Franky I cannot see the harm in a link to them when they are responding to an asked question. I find the links generally very usefull Feed back i have from customers is very good. Being smaller and lighter than other crankup models as its advantages. Removing the link of the importer of these units doesnt seem to make sense Just have to Google away Hes got a link at the bottom of his post as has anyone who has a website. And some of you have been members for how long Please enter your desired user name, your email address and other required details in the form below. Note that passwords are casesensitive. Thinking mainly of Sky coverage of BBC and ITV channels in UK and Europe. If you have experience of these dishes would be grateful to receive your input. Richard Thinking mainly of Sky coverage of BBC and ITV channels in UK and Europe. If you have experience of these dishes would be grateful to receive your input. Richard Was told by our local dealer that for S. France and Spain I would need the Camos plus dishthumb Was told by our local dealer that for S. <http://www.frankenfoto.de/userfiles/ejemplo-de-manual-de-marca.xml>

France and Spain I would need the Camos plus dishthumb Thinking mainly of Sky coverage of BBC

and ITV channels in UK and Europe. If you have experience of these dishes would be grateful to receive your input. Richard I am going to use a camos black box receiver with it. If you search the forum you can pick up a lot of good and well informed information Cheers Jimthumb I was thinking of getting one of them installed but I'd like to know how they are in Southern Europe and Northern Scotland. The other camos make is the dome which is a different kettle of fish. The camos flat sat plus is slightly larger than the camos flat sat. Hop onto the Road Pro web site and it's all on there. Or have a word with Dave Newell who is a franchised dealer for Road Pro I believe. I'm sure that he will be able to tell you all about them. Cheers Jim I was thinking of getting one of them installed but I'd like to know how they are in Southern Europe and Northern Scotland. An offset dish looks as though it is trying to look at the ground if you see one in Northern Scotland, but they still work. Reception, using a Maplins minisat kit receiver, is excellent and locking into a signal really is a doddle. I have used it here in Mid Wales and as far down as Oberstdorf in Germany and all points between. From wind up, to rotate the dish and get a signal, takes me less than two minutes. I bought the Plus as I wanted full European coverage and although it has a skew facility I have yet to use it. If you do skew the dish, you need to adjust two butterfly screws on the back of the dish which obviously requires roof access. The very small profile of the dish was the reason why I chose it as space on the van roof was at a premium. It really is small compared to the Maxview setups I have had previously and is very neat and unobtrusive in both the upright or parked position.

No wind noise when travelling at speed on the Autobahn and impressive stability during a windy day which would have seen me lowering the Maxview. Also, when it is lowered it does not look like an expensive satellite dish, which is a security plus. Installation took two hours, one hour of which was measuring, checking cables and building up the courage to cut a 38mm hole in the roof. All in all it does exactly as described. Easy to fit, easy to align and very nice looking when up and hardly noticeable when down. Highly recommended. I purchased mine from Roadpro and received a highly professional and courteous service. Pat No wind noise when travelling at speed on the Autobahn and impressive stability during a windy day which would have seen me lowering the Maxview. Reception, using a Maplins minisat kit receiver, is excellent and locking into a signal really is a doddle. Highly recommended. I purchased mine from Roadpro and received a highly professional and courteous service. Pat It is fixed to the roof using an adhesive such as Sikaflex 512 and has ten predrilled holes for the stainless steel selftapping screws provided in the kit. The link below is the fitting guide which shows the dish and all of the components Flat Sat manual.pdf I assume that the ribbed roof you mention is one with raised structural ribs with lower inner panels. If that is the case, the mount would fit in the lower inner panels. The next question is whether the external roof position is above a clear inner roof position for the handle and rotating knob assembly. Pat I pick up the vehicle next Friday so haven't had a chance to look at the roof from above but I was hoping that the base would fit in the flat area between the ribs. I'll have a look at the installation guide. I would like to put the Camos above the wardrobe so should have plenty of width to choose a flat area.

It should be easy to run the antenna cable above the headlining to the Sky box which will be in a cupboard immediately opposite the wardrobe. The next dilemma I have will be whether I have the bottle to drill the roof or pay the money to have it done for me! The Weingard mount base is 20mm wide by 23mm long. It tapers towards the rear. There are two holes to drill in the roof, the main mount and the coax cable inlet. As for fitting, the cheapest quote I got was 150 and whilst I admit that drilling through the roof concentrated my mind, my wallet made the decision for me. As yours is a brand new van it would be worth checking with your supplying dealer as to any warranty implications should you go the DIY route. However, it really is a very simple job. PM if you would like any further details on fitting. Pat If you encounter cables it may be possible to push them to one side or if too short, extend them and push out of the way. HTH Jim Until I get the vehicle next Friday I won't know whether the headlining in the wardrobe can be removed, which would make the job a lot easier. I'm aware of being cautious of any cables running through but it would be just my luck to

drill through on a metal beam. I might ring Autosleepers and get their advice. I've been using a Multimo dish for a couple of years which has been fine but I never like leaving it outside overnight in case it disappears. Going outside in the pouring rain at 11pm to bring it in is not my idea of fun, hence the Camos. I would really like a self seeking dish but the Camos dome is too quirky and the others cost a fortune. Roly Until I get the vehicle next Friday I won't know whether the headlining in the wardrobe can be removed, which would make the job a lot easier. Would the owners of the Camos Plus ideally 40cm twin LNB wish to make some recommendations. It's a single LNB, however. The equipment is very easy to use, it's easy to tune in, gets great reception, doesn't move in the wind and looks smart.

I would recommend it. Jim It's a single LNB, however. I would recommend it. Jim The only thing to be aware of is if you have a panel van conversion like mine the metal sides play havoc with the compass. After a while you can guess where the satellite needs to face. It takes a couple of minutes this way!. I spent hours cursing the dish, the manufacture, Silva compasses etc. Then realised, as always, that sometimes you need to think oh By the way Leisuretech in Clitheroe did a nice neat job in fitting my dish Ronidog Fitting was easy. Using a compass and the compass card fitted under the cranking handle we often get signal lock before turning on the tv and box it really is that easy Used it all the way down through France, only struggled once on south coast near Cannes, couldn't get BBC1, 2 and ITV, still got 4 and 5 though. GREAT piece of kit and it's SO much more civilised than being outside with a tripod and 65cm dish trying to hear what the boss is telling me! Ginny and Mike Ginny and Mike They will give you all the info you want, straight from the horse's mouth so to speak. Or Dave Newell whose name and number are at the top of the page. Jim When we were in Spain with the tripod and dish we could get all the channels we subscribed to just as we do at home. Ginny When we were in Spain with the tripod and dish we could get all the channels we subscribed to just as we do at home. Ginny You may have to retune to the South beam on Astra 2D. You may have to retune to the South beam on Astra 2D. If you are calling at Santa Suzanna on your way down in December, they have free wifi now so we look forward to keeping in touch whilst you are away. Ginny By continuing to use this site, you are consenting to our use of cookies. Some people will no doubt be delaying purchases believing that a new system is on the horizon which will receive UK TV All over Europe.

This isn't the case, manufacturers cannot invent a special gadget to resolve the difficulties with receiving satellite television on edge of footprints. Fundamentally nothing has changed, i.e. to receive a UK Satellite TV signal away from home the simple caveat of biggest is best will still apply. An 85cm satellite system has far more chance of receiving a signal vs a smaller 40cm system. The Only technologies that have a bearing on reception of UK TV abroad are as follows In fact most of the nation's favourite programmes are available free on these channels. Freeview reception in a motorhome needs the following items For European TV Reception of UK Language channels such as BBC1 etc you will require a Satellite Dish based system. Examples of Planar systems are the Avtex Snipe and the Camos Crankup Flat Sat System, parabolic systems are not widely utilised in the motorhome industry although systems like the Globosat satellite system still persist. Their popularity is no doubt down to their small roof footprint, usability in high wind conditions and lower pricing than other fully automatic systems, but the price of a dome based system is the dish size within. Portable satellite tv dishes vary from 30cm diameter to 85cm. Although the size of a satellite dish has the biggest effect on what you can receive, the location you are using it in has a large bearing, it is not simply a matter of "bigger is better". The design of the dish and the L.N.B. see below also affect reception. Different channels are broadcast in different ways and may not be available where you are. In the case of all domestic and some mobile satellite dishes, it's the mushroomlike half dome object mounted on an arm and pointing towards the dish's centre. The quality of the L.N.B. is vital for the reception of a strong, clear signal and a good L.N.B. attached to a small dish can be just as effective as a large dish with a less efficient L.N.B.

Some dishes such as the Kathrein do not have visible LNBs and correspondingly have a flat surface. Teleco have taken this to the maximum with their FlatSat Range of systems which are only 17cm tall when in driving position. Some satellite dishes have their L.N.B.s located behind the dish and this results in comparatively small dishes whilst retaining the reception characteristics of much larger ones. These satellite systems are permanently installed on the roof of a vehicle but are raised manually from inside either by pole or a crank device. They are very easy to install and with a little practice they are also easy to use. Temporary mounting of a satellite dish can be achieved using a tripod stand fixed to the ground, a suction mount attached to a flat surface such as a roof, for example, or a bracket attached to a pole or ladder. These methods are very simple to use but even permanent mounting is well within the capabilities of any competent handyman. One useful feature of satellite transmissions is that the signal can pass through certain materials, including plain window glass and the kind of plastic that caravan windows are made of. Therefore, in areas where the signal is strong, a Multimo satellite dish can even sit on a table inside a vehicle or an awning bearing in mind line of sight to the satellite itself. The base can be removed if required and the dish attached to a tripod or pole using the clamp supplied. The SKY digibox is the best known in the U.K. and, if you want to receive SKY's subscription channels, you must use one, along with a subscriber viewing card. The receiver is connected by a coaxial cable to the dish with maybe a satellite finding meter inline and to the TV via a SCART or R.F. lead, both of which are usually supplied. More modern receivers built specifically with the motorhome market in place are Free To Air receivers, run on 12v or 230v and are HD capable such as the Rockdale satellite receivers or Comag receivers.

The viewing card slots into the digibox and gives it permission to decrypt some or all of the channels being transmitted by the satellite. It must then be activated before it can be used. The card should then be activated within a few hours but it should all be left connected and switched on until the card is working properly. Make sure you are on hookup or have sufficient battery power to remain connected and switched on !! The people at SKY will explain exactly what to do and how to do it. Note that using this viewing card outside the UK is considered to be a breach of contract so, if BskyB find out, they'll transmit a signal to disable your card. Cards can be moved from digibox to digibox but subscription channels will not be available and there is a chance that the card may be deactivated under certain circumstances see above. The inverter can be simply plugged into a standard lighter socket. You can also look around to see if you can spot either household dishes or other motorhome or caravan dishes that are deployed and see which direction they are pointing in. With the help of a satfinder meter, the job takes only a few seconds. A satfinder is a small meter like device which, using some form of indicator visual and sometimes audible, makes locating a satellite easy, reliable and quick. An additional advantage is that it's not necessary to be able to see the screen. The satfinder meter is connected inline between the dish and the receiver and should be disconnected when the satellite has been found. There are more upmarket and intelligent finders available such as the Teleco DSF80 which can ensure you are not trying to align to the incorrect satellite. You may hear other motorhomers and caravanners say they received these channels with a much smaller dish, but these stories can usually be taken with a pinch of salt unless extraordinary weather reception conditions took place. You are still free to buy a second "digibox" and take it away with you.

Why I left it so long to order the handbrake extender I don't know it is wonderful. Before each time I had to put the brake on or take it off my wife said it looks as if you are going to sleep as I. Read more. The installation was extremely straightforward and I couldn't be more pleased that domestic gas replenishment is no longer a problem or chore. Many thanks,. Read more. Click [HERE](#) to see all the details on our end of season clearance sales and any Special Offers we have on. You should upgrade or use an alternative browser. My Van is a Bailey Ranger GT60 2 Berth. The flexibility of a dish on a tripod is hard to beat as it can be placed anywhere on your pitch to obtain a signal. The other issue is that in high winds the dish would rip the caravan roof off if you didn't put it down in

time. I'm minded to get a fully automated dome dish for my next caravan quite a bit more expensive but safer than any dish in high wind, whether roof or tripod mounted in our case we rarely use formal sites with small relatively pitches, preferring CLs and good commercials. I chose the Semitronic because it is mounted on a pole that is attached firmly inside the van thus taking the strain off the roof. Hope that helps. One slight drawback with the Semiktronic is that it doesn't like cold weather so if it's windy and at freezing or below it won't lower unless you stand on the bed and warm it up via the Heki roof light using a hair dryer. Never had any wind problems and get excellent signal. We find much better than the tripod type satellite set up systems as we never have trouble with losing the signal because of wind or someone accidentally knocking into it. Also if you are a winter caravanner you are setting up in the warm and dry with a cuppa in the other hand. Be careful of those commenting who had never tried one, in our opinion an excellent piece of kit. We do have a substantial roof on our caravan, German the type you can walk on.

Gordon We do have a substantial roof on our caravan, German the type you can walk on. Gordon We've been out in Storm Force 10 when it was almost impossible to stand. But I think the difference is your very solid roof! Best advice is to speak to a couple of companies that fit satellite dishes on caravans and ask them if they have any experience of the Camos Flat Sat. Gordon As previously mentioned phone round a few companies that specialise in roof mounted dishes, I did before I decided to go ahead. I had a dealer fit mine cos putting a hole in the roof you only get one chance and there is always the possibilities of wiring in the roof. There are directions and experiences of caravanners fitting dishes to caravans on the internet, at least one on fitting the Camos. But I considered it and chickened out, would have liked to have a go it did not look complicated but as I said only one chance with a hole in the roof. Gordon All rights reserved.
