This below solved example problem for frequency distribution standard deviation may help the users to understand how the values are being used to work out calculation based on the above mathematical formulas. Example: In a class of students, the scores in 10 tests are as follows: 50, 55, 60, 65, 70, 75, 80, 85, 90, 95, 100. Find the mean, standard deviation, and variance. Solution: Step 1: Calculate the mean. $\bar{x} = \frac{50+55+60+65+70+75+80+85+90+95+100}{10} = 75$. Step 2: Calculate the standard deviation. $s = \sqrt{\frac{1}{n} \sum (x_i - \bar{x})^2} = \sqrt{\frac{1}{10} (25+16+9+4+1+0+1+4+9+16+25)} = \sqrt{10} \approx 3.16$. Step 3: Calculate the variance. $s^2 = 10$.

For example: 10 20 30 40 50 60 70 80 90 100Simple. Write data elements (separated by spaces or commas, etc.), then write f: and further write the frequency of each data item. Each element must have a defined frequency that counts numbers before and after the symbol f: must be equal. For example:1.1 2.5 3.99f: 5 10 15Grouped data are formed by aggregating individual data into groups so that a frequency distribution of these groups serves as a convenient means of summarizing or analyzing the data. groupfrequency 10-205 20-3010 30-4015This grouped data can be entered as: 10-20 20-30 30-40f: 5 10 15Similar to a frequency table, but instead, f: write cf: in the second line. For example:10 20 30 40 50 60 70 80cf: 5 13 20 32 60 80 90 100The cumulative frequency is calculated by adding each frequency from a frequency distribution table to the sum of its predecessors. The last value will always equal the total for all observations since the calculator will have already added all frequencies to the previous total.Gradually 34921 We gradually measured the values of 3,8,13,10,1,13,10,5,3,9.
